

# K.S. INSTITUTE OF TECHNOLOGY, BANGALORE - 560109

## I SESSIONAL TEST QUESTION PAPER 2019 - 20 ODD SEMESTER

**SET - A/B**

USN									
-----	--	--	--	--	--	--	--	--	--

**Degree** : B.E  
**Branch** : Computer Science & Engineering  
**Course Title** : Computer Networks  
**Duration** : 90 Minutes

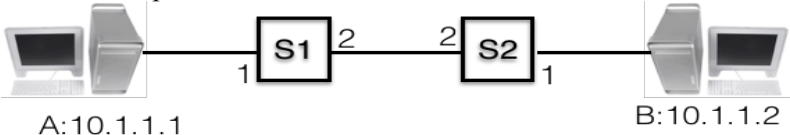

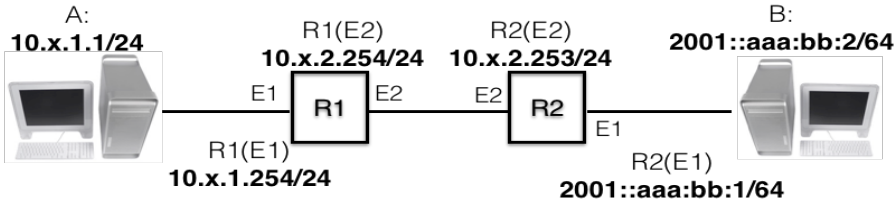

**Semester** : V  
**Course Code** : 17CS52  
**Date** : 21-Oct-2019  
**Max Marks** : 30

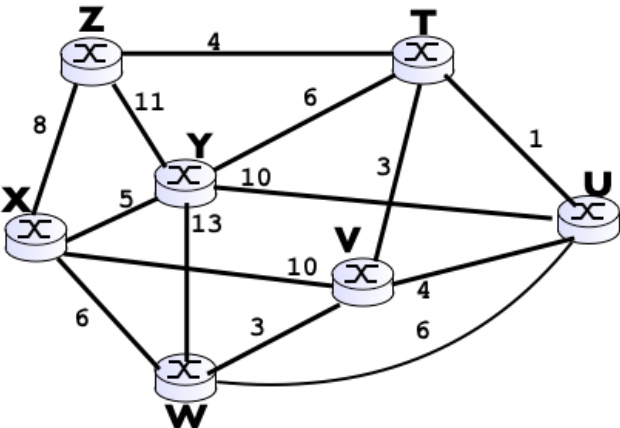

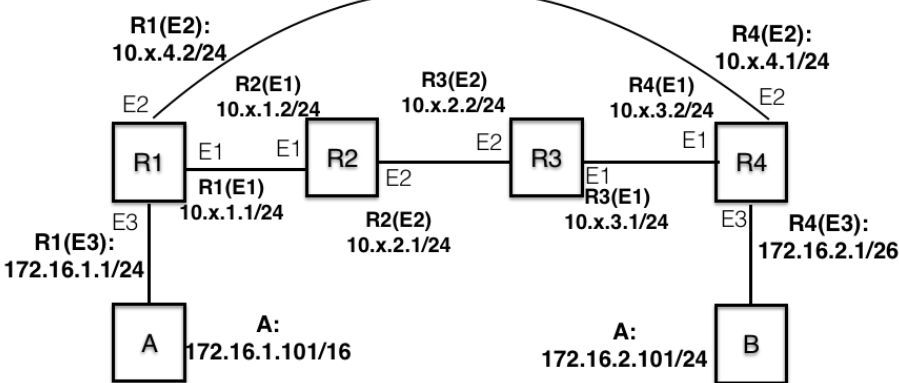

**Note:**

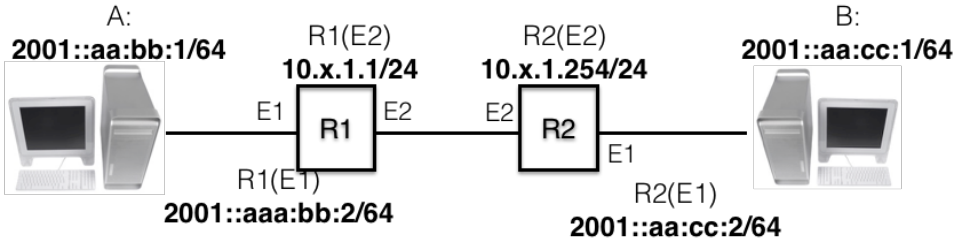

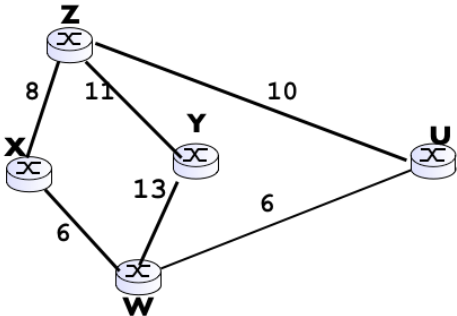

1. Answer ONE full question from each part.
2. This is an open book exam. Any printed material, handwritten notes etc. is allowed.
3. Sharing of books, notes, printed material is not permitted.
4. Use of calculator is permitted, but no other electronic gadget is permitted.

Q No.	Question	Marks	CO mapping	K-Level
<b>PART-A</b>				
1(a)	<p>Suppose within your web browser you click on a link on website <a href="http://ksit.edu.in">http://ksit.edu.in</a> to obtain a web page <a href="http://ksit.edu.in/cse.html">http://ksit.edu.in/cse.html</a>. Suppose that this web page is redirected N times on the same host (where <math>N=x+5</math>, where <math>x=ddd\%5</math>, where ddd corresponds to last 3 digits for your USN number), such as 1<sup>st</sup> redirect is to cse2.html, 2<sup>nd</sup> redirect is to cse3.html and so on till cseN.html. Each of this respective web page access take round trip time of 1 second, 2 seconds, ..., N seconds. Further, suppose that the final web page cseN.html contains N embedded images with urls as <a href="http://img.ksit.edu.in/img1.jpg">http://img.ksit.edu.in/img1.jpg</a>, <a href="http://img.ksit.edu.in/img2.jpg">http://img.ksit.edu.in/img2.jpg</a>, ..., <a href="http://img.ksit.edu.in/imgN.jpg">http://img.ksit.edu.in/imgN.jpg</a>, and round trip time for img.ksit.edu.in is 2s. Consider that your browser is configured to make N parallel persistent connections. <b>Analyze</b> these HTTP accesses w.r.t. RTT and <b>compute</b> the total time taken when the client clicks on the link until the web page is rendered with all embedded objects.</p> <p>Note: Example for computation of N. If your USN is 1KS17CS031, then <math>N=5+31\%5+5+1=6</math>. If your USN is 1KS16CS112, then <math>N=5+112\%5 = 5+2=7</math>.</p>	5	CO1	Analyzing
(b)	<p>TCP is considered as a streaming and reliable protocol. Consider the following network setup.</p> <div style="text-align: center;"> <pre> graph LR     A[A: 10.1.1.1] --- 1  S1[S1]     S1 --- 2  S2[S2]     S2 --- 1  B[B: 10.1.1.2]           </pre> </div> <p>Consider that TCP application at host A sends 8 messages, each message of 10 bytes every 2 seconds to application at host B. The content of these 8 messages are follows:</p> <p>             T0: AAAAAAAAAA              T2:BBBBBBBBBB              T4:CCCCCCCCCC              T6:DDDDDDDDDD              T8:EEEEEEEEEE              T10:FFFFFFFFFF           </p>	5	CO2	Applying

	<p>T12: GGGGGGGGGG T14: HHHHHHHHHH</p> <p>The application at B reads a maximum of 30 bytes every 2 seconds and displays the data read from the TCP socket. Consider that link between switch S1 and S2 is broken at time T=5s and restored at time T=9s. Knowing that TCP is reliable and streaming protocol, <b>determine</b> what message content would be displayed (i.e. values corresponding to ??) at host B every 2s. You can assume that there is no propagation, transmission, queuing and processing delay in the network.</p> <p>T0: ?? T2: ?? T4: ?? T6: ?? T8: ?? T10: ?? T12: ?? T14: ??</p>			
(c)	<p>Consider TCP header format as per TCP protocol (RFC 793).</p> <pre> 0          1          2          3 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 +---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+                                 Source Port                                 +---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+                                 Sequence Number                             +---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+                                 Acknowledgment Number                       +---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+    Data     Offset    Reserved   U A P R S F  Window  +---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+                                 Checksum                                 +---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+                                 Options                                 +---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+                                 data                                 +---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+---+ </pre>			
	<p>You are given the following wireshark capture corresponding to TCP protocol (complying with TCP header format given above). 0050 c4a6 0a89 4d85 ea44 de48 5011 ffff 5c02 0000 0000 0000 0000</p> <p>For this packet capture, <b>determine</b> the following</p> <ol style="list-style-type: none"> <li>Source Port number (in decimal)</li> <li>Which of the TCP flags bits are set</li> <li>What is value of receive window size (in decimal)?</li> <li>What is the length of TCP header</li> <li>What is the value of urgent pointer (in decimal)</li> </ol>	5	C02	Applying
OR				
2(a)	<p>Consider a network consisting of a server and 20 peers. A file of size 50MBytes (1byte=8bits) lying with a server is to be distributed to all 20 peers using P2P communication architecture. The server upload speed is 10Mbps and each peer upload speed is 2Mbps. Each peer download speed is 20Mbps. Assuming underlying network has unlimited capacity, <b>evaluate</b> the minimum time required to distribute the file using a single chunk to all peers and analyze your computation mechanism.</p>	5	C01	Analyzing

(b)	<p>TCP is considered as a streaming and reliable protocol. Consider the following network setup.</p>  <p>A: 10.1.1.1                      B: 10.1.1.2</p> <p>Consider that TCP application at host B sends 7 messages each of 10 bytes every 2s as follows:  T0: AAAAAAAAAA  T2: BBBBBBBBBB  T4: CCCCCCCCCC  T6: DDDDDDDDDD  T8: EEEEEEEEEEE  T10: FFFFFFFFFF  T12: GGGGGGGGGG</p> <p>The application at B issues a read request to read maximum of 4 bytes every 2 seconds and displays the data read from its socket. Knowing that TCP is a reliable and streaming protocol, <b>determine</b> that message content that would be displayed (values corresponding to ??) at host B every 2s. You can assume that there is no propagation, transmission, queuing and processing delay in the network.</p> <p>T0: ??  T2: ??  T4: ??  T6: ??  T8: ??  T10: ??  T12: ??</p>	5	CO2	Applying
(c)	<p>Consider the case that an application at host A needs to communicate with an application at host B using TCP to send a single message having 10 bytes of data as “ABCDEFGH IJ”. Application at B acts as receiver only and does not send any application data. Assume that TCP connection at A uses ISN (Initial Sequence Number) value of 1000, and TCP connection at B uses ISN value of 2000. Assume that network is reliable and error free i.e. no packet corruption, loss or duplication, and in order delivery. <b>Construct</b> the TCP timeline sequence diagram for this TCP connection between A and B (covering connection setup, data transfer and teardown), and for each communication on this timeline sequence, <b>identify</b> the following field values:</p> <ol style="list-style-type: none"> <li>Sequence number</li> <li>Acknowledgement number</li> <li>TCP Flags</li> </ol>	5	CO2	Applying
<b>PART-B</b>				
3(a)	<p>Consider the following network where x corresponds to last 2 digits of your USN.</p>  <p>A: 10.x.1.1/24                      B: 2001::aaa:bb:2/64</p> <p>R1(E2) 10.x.2.254/24                      R2(E2) 10.x.2.253/24</p> <p>R1(E1) 10.x.1.254/24                      R2(E1) 2001::aaa:bb:1/64</p> <p>Host A wants to communicate with host B. Explain which IPv6 transition strategy needs to be used to enable this communication between A and B. <b>Identify</b> the device or devices among A, R1, R2, B where this transition strategy will be implemented and <b>explain</b> your reasoning.</p>	5	CO3	Understanding

(b)	<p>Consider the following network consisting of 7 routers with their edge costs depicted along the edges. Use Dijkstra's shortest path algorithm to compute the shortest path from router Z to all other routers. <b>Show</b> how the algorithm works at each step of the iteration i.e. i) show the value of set N' (the subset of nodes for whom least cost path is already computed), ii) D(v) the cost of the least cost path from node to destination v, and iii) its predecessor p(v)</p> 	5	C03	Under standing																
(c)	<p>Consider the following network consisting of 4 routers and two hosts. The x in the IP addresses corresponds to last 2 digits of your USN.</p>  <p>The default gateway for host A is 172.16.1.1, and default gateway for host B is 172.16.2.1. The default gateway for each of the router is as follows. R1: 10.x.1.2; R2: 10.x.2.2; R3: 10.x.3.2; R4: 10.x.4.2 The other routing entries for router correspond to their locally connected networks without any destination gateway. For example, for Router R2, the complete routing table entries are</p> <table><tr><th>Dstn N/w</th><th>Mask</th><th>Gateway</th><th>Interface</th></tr><tr><td>10.x.1.0</td><td>/24</td><td>-</td><td>E1</td></tr><tr><td>10.x.2.0</td><td>/24</td><td>-</td><td>E2</td></tr><tr><td>0.0.0.0</td><td>/0</td><td>10.x.2.2</td><td>E2</td></tr></table> <p>The other routers have similar entries corresponding to their locally connected network. Consider that host A sends one ping packet to host B i.e. with destination IP as 172.16.2.101, having a TTL value of 10 (in IP header). <b>Determine</b> if this packet will be delivered to host B or not. If it is delivered, what will be TTL value when it is received by B. If it is not delivered to host B, then determine destiny of this packet.</p>	Dstn N/w	Mask	Gateway	Interface	10.x.1.0	/24	-	E1	10.x.2.0	/24	-	E2	0.0.0.0	/0	10.x.2.2	E2	5	C04	Apply ing
Dstn N/w	Mask	Gateway	Interface																	
10.x.1.0	/24	-	E1																	
10.x.2.0	/24	-	E2																	
0.0.0.0	/0	10.x.2.2	E2																	
OR																				
4(a)	Consider the following network where x corresponds to last 2 digits of your USN number.	5	C03	Under standing																

	 <p>An application at host A wants to communicate with application at host B. Identify which IPv6 transition strategy needs to be used to enable this communication between A and B and on which device(s). Consider that A sends one UDP packet to B. <b>Illustrate</b> the source and destination IP address for this UDP packet transmission at each of the link in this network.</p>			
(b)	<p>Consider the following network and assume that each node initially knows the costs to each of its neighbors. Consider the distance vector routing algorithm and <b>show</b> the distance table entries at node Y after exchange of routing messages in each iteration step.</p> 	5	C03	Under standing
(c)	<p>Consider that you as an IT Administrator have been asked to take a backup of all the 100Giga Bytes data of <code>cse.ksit.edu.in</code> server to a backup server at <code>cse.kssem.edu.in</code>. You have two choices to transfer the data.</p> <p>Choice A: First one is take a backup on portable SDD hard disk at KSIT which takes 30 minutes, carry it to KSSEM by your own transport (car) which takes another 30 minutes and then copy from the SDD hard disk to the backup server at KSSEM which takes another 30 minutes.</p> <p>Choice B: use the ISP (Internet service provider) link that provides a reliable TCP connection throughput of 100Mbps.</p> <p><b>Identify</b> the choice that you will make to achieve your task and explain your reasoning.</p>	5	C04	Apply ing
