Chapter 6 Wireless and Mobile Networks

A note on the use of these ppt slides:

We're making these slides freely available to all (faculty, students, readers). They're in PowerPoint form so you see the animations; and can add, modify, and delete slides (including this one) and slide content to suit your needs. They obviously represent a *lot* of work on our part. In return for use, we only ask the following:

- ❖ If you use these slides (e.g., in a class) that you mention their source (after all, we'd like people to use our book!)
- ❖ If you post any slides on a www site, that you note that they are adapted from (or perhaps identical to) our slides, and note our copyright of this material.

Thanks and enjoy! JFK/KWR

*Computer
Networking: A Top
Down Approach*
6th edition
Jim Kurose, Keith Ross
Addison-Wesley
March 2012

Data Comm Standards

- GSM
 - Frequencies
 - Uplink: 890.1 - 914.9 MHz, Downlink: 930-956MHz
 - Each channel 200KHz, 124 channels, 8 timeslots/channel
- Generations
 - 1G - Voice only
 - 2G: GPRS - 14.4kbps
 - 2.5G/2.5+G :Enhanced GPRS : 100kbps
 - 3G: 2Mbps, both voice and data simultaneously
 - 4G:All IP
- CDMA: IS-95, CDMA2000, IMT-2000, WCDMA
- UMTS: CDMA for efficiency, GSM for compatibility

Cellular Networks Structure

- Adjacent cells in various directions
- Distinct freq. in adjacent cells
 - Avoids frequency interference
- Base stations connect among themselves
 - Guided
 - Wireless networking
- Allows handover
 - Phone moves from one cell to another
 - Connection moves to neighbor base station

GSM Network...

- Supplementary (Other than Voice) services
 - Code description
 - **<http://portal.etsi.org/hf/brochure/servicer1.pdf>**
 - Common patterns
 - *service# Activate
 - **service# Register and activate
 - *#service# Check Status
 - #service# Unregister
 - ##service# Unregister and deactivate
- **To know your IMEI**
 - ***#06#**

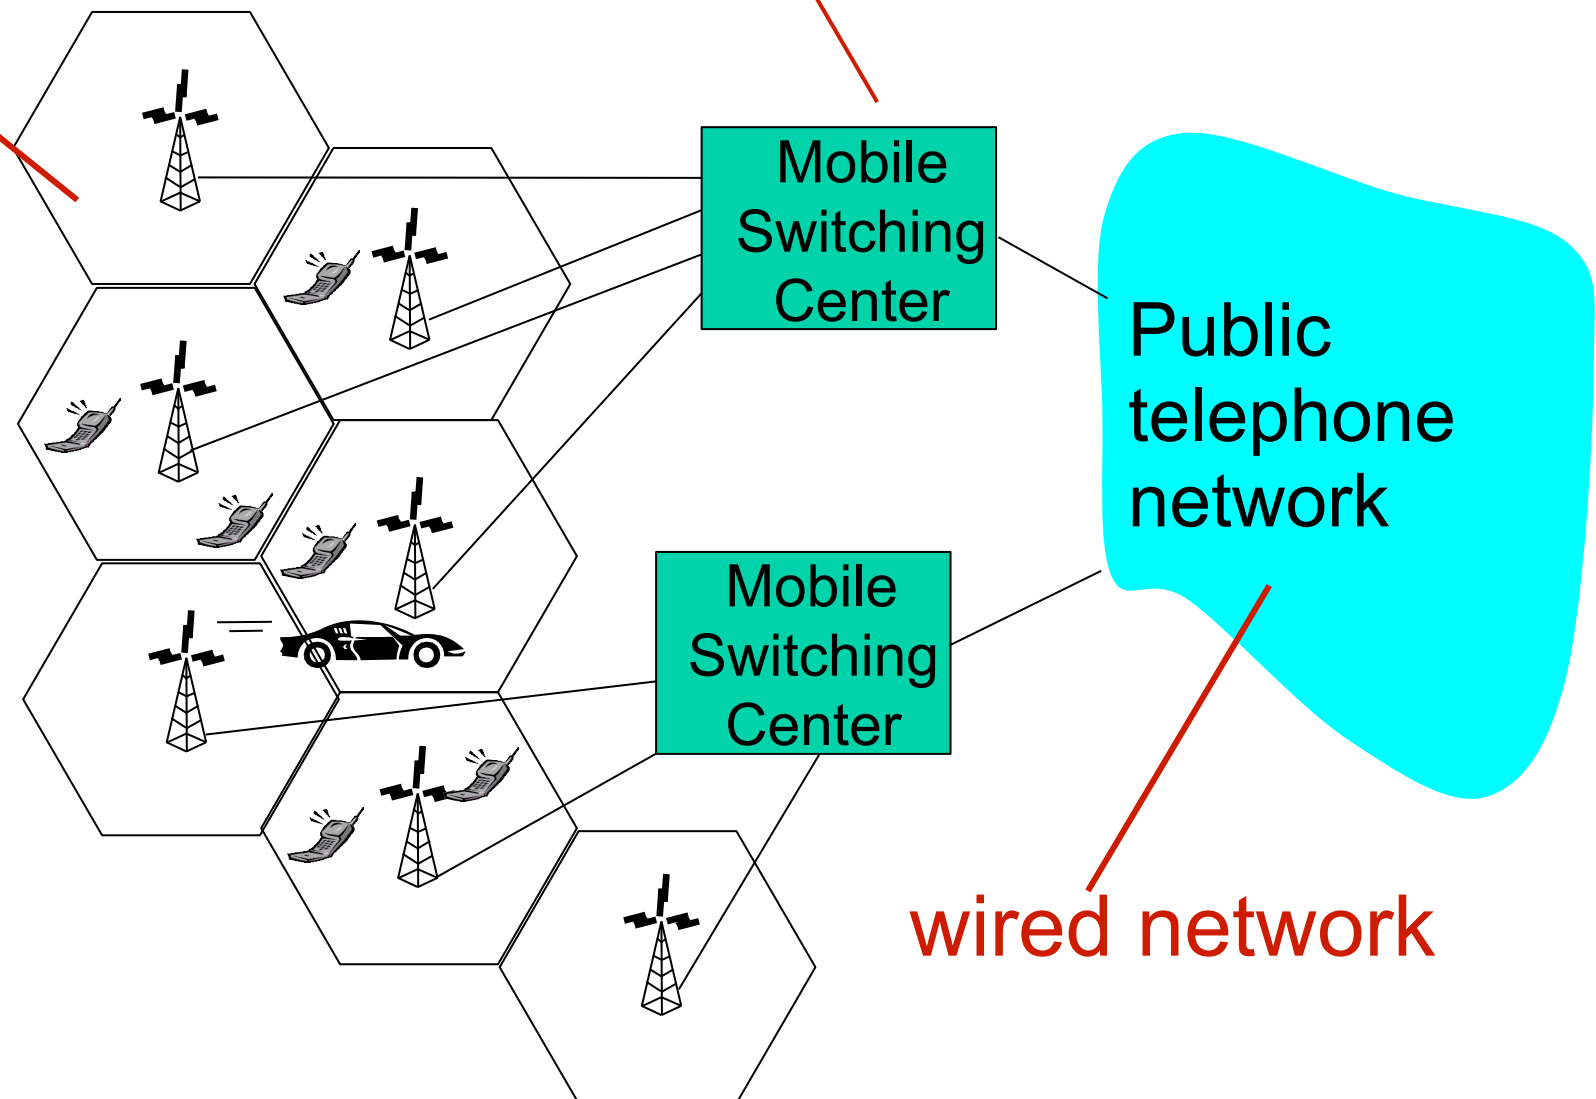

Components of cellular network architecture

cell

- covers geographical region
- *base station* (BS) analogous to 802.11 AP
- *mobile users* attach to network through BS
- *air-interface*: physical and link layer protocol between mobile and BS

MSC

- connects cells to wired tel. net.
- manages call setup (more later!)
- handles mobility (more later!)

Cellular networks: the first hop

- Two techniques for sharing mobile-to-BS radio spectrum
- **combined FDMA/TDMA**: divide spectrum in frequency channels, each channel into time slots
 - channel: 200KHz
 - 8 Timeslots/channel
- **CDMA**: code division multiple access

time slots

frequency
bands

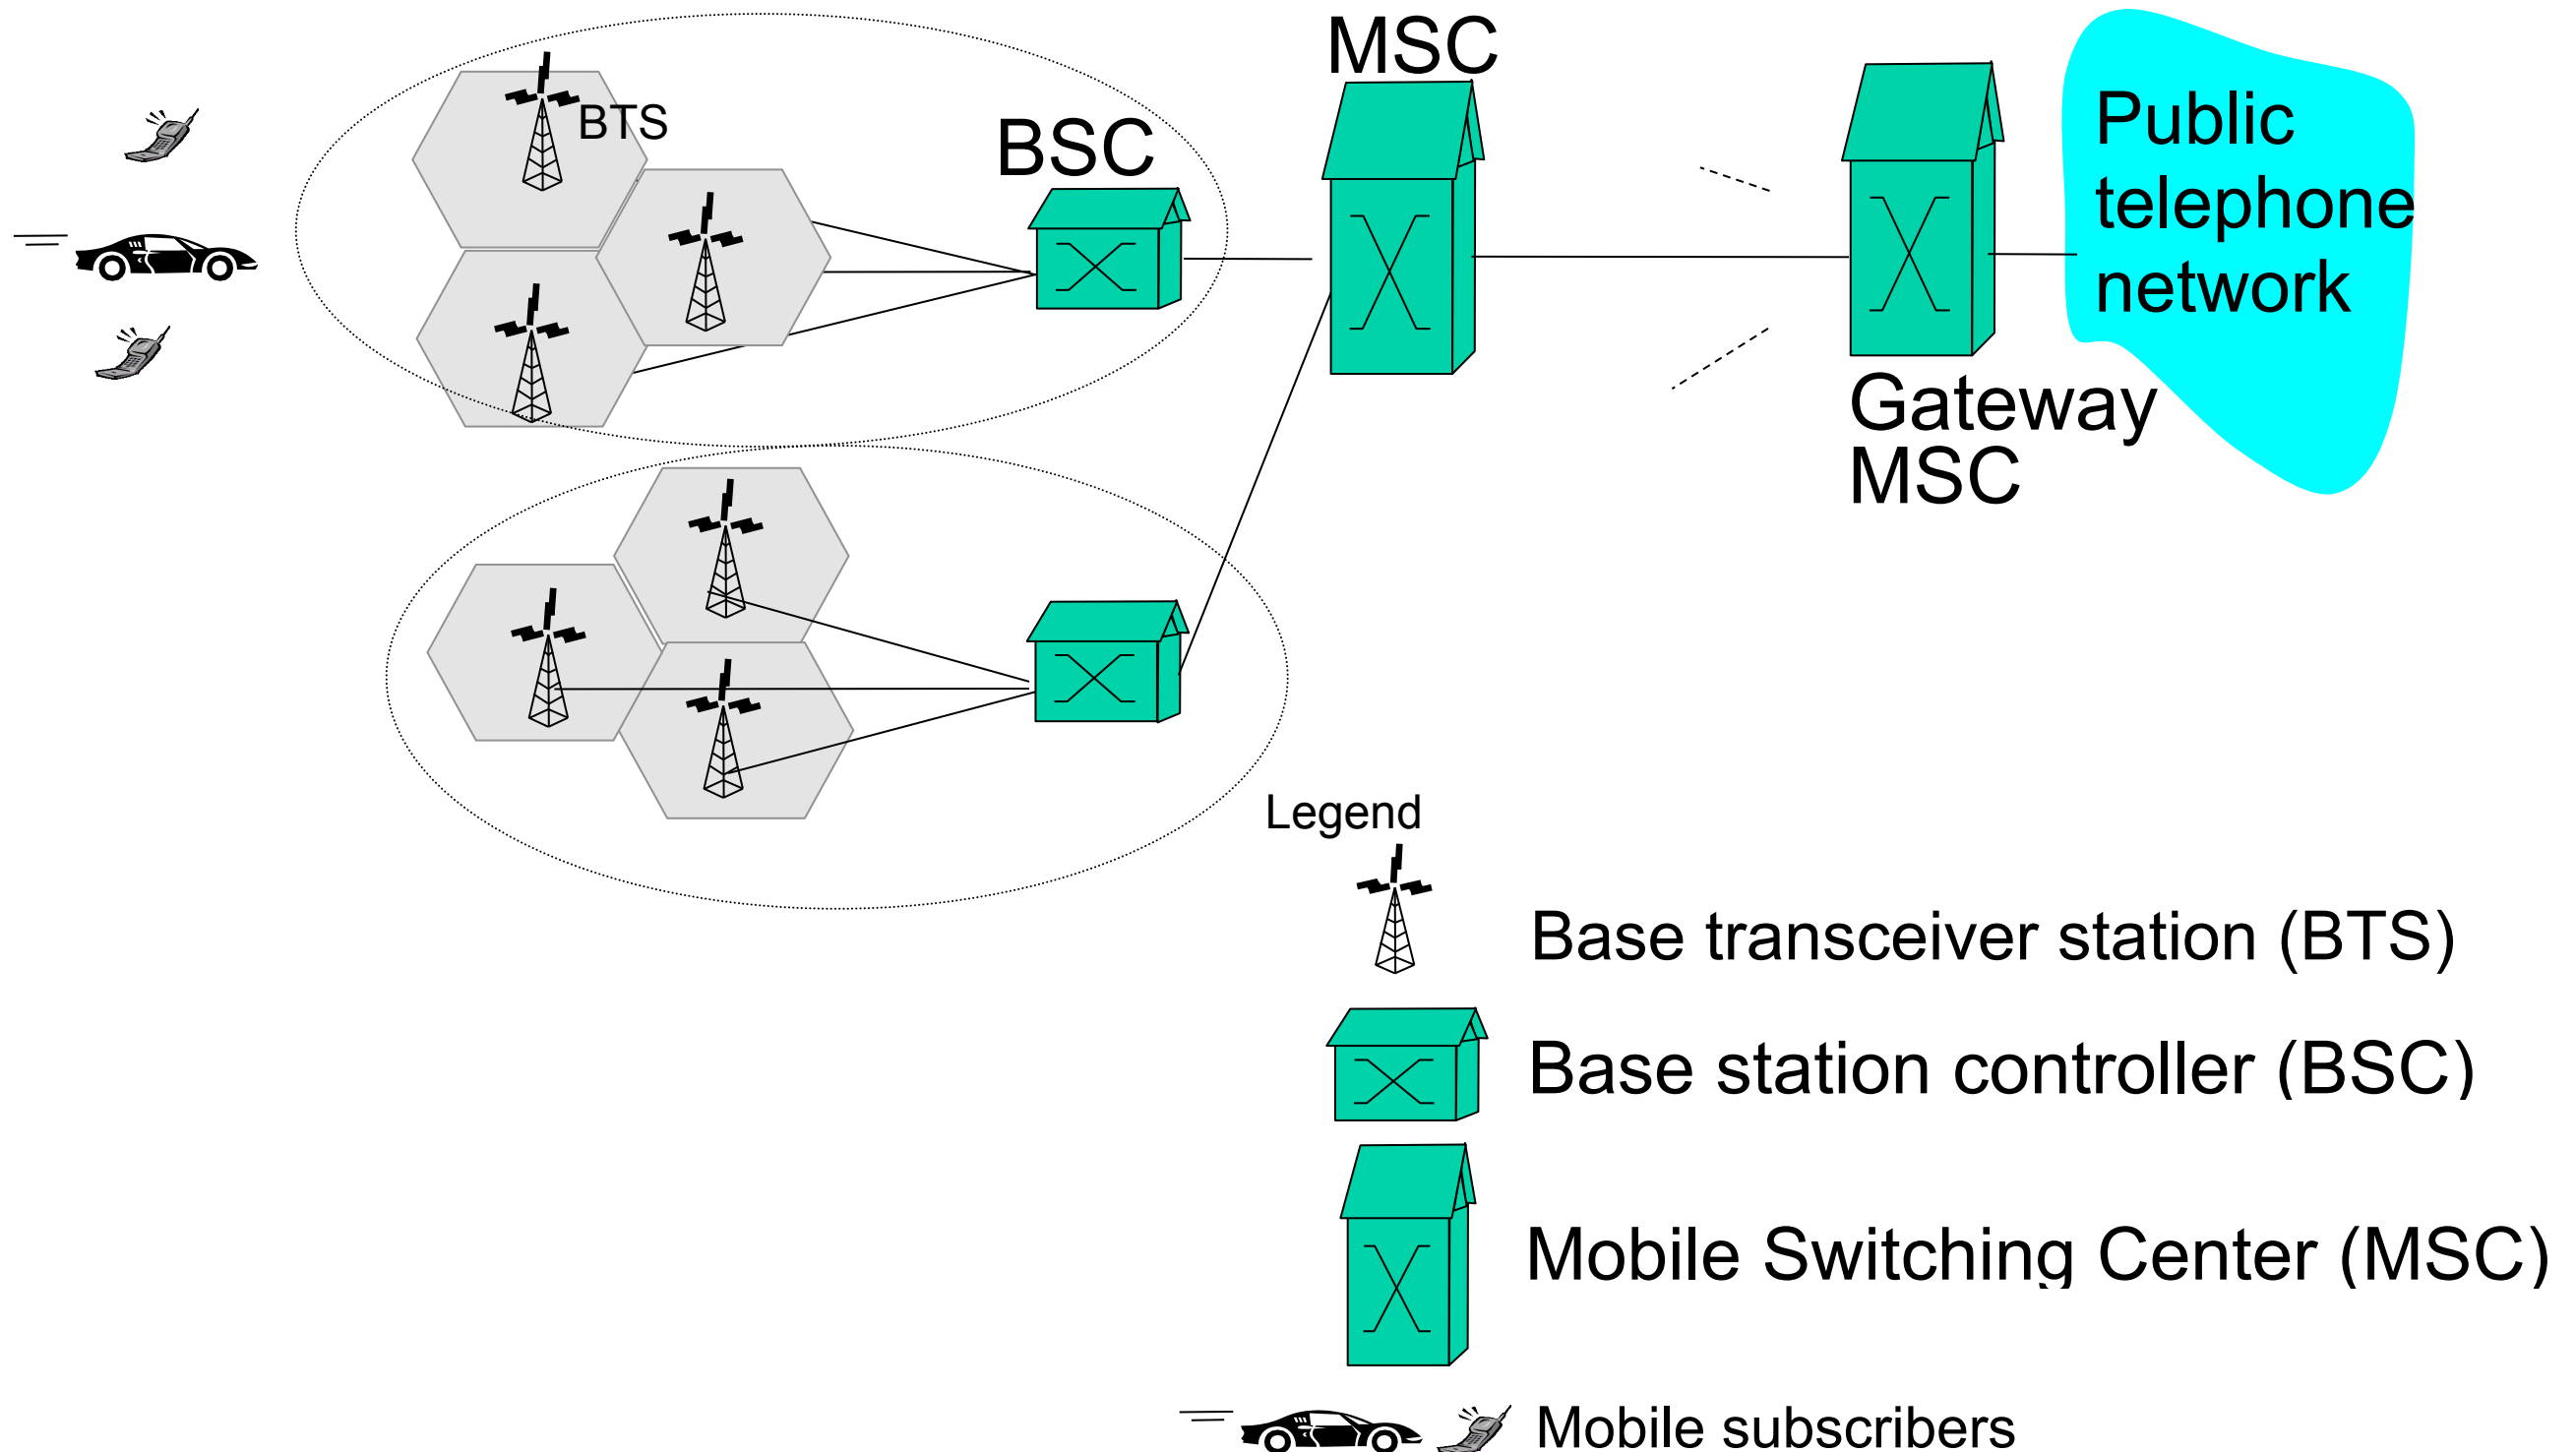

BTS...

- GSM Channels
 - Total 124
 - Permitted to use Ch02 to Ch123
 - (thus total of 122)
 - 32 channels are reserved for data transmission of operator
- Total channels assigned to a BTS is 11
 - One for transmission to MS or BSC
 - 10 for users
 - All BTS taken together can communicate over 90 channels

2G (voice) network architecture

Base station system (BSS)

BSS

- BTS
 - Like an AP in WiFi network
 - Covers one cell
 - Area depends upon transmitting powers
 - BTS, user devices, height of tower antennae
 - Initially at the center of hexagon cell, now directional
- BSC
 - Services several BTS
 - Allocate radio channels to mobile subscribers
 - Perform paging (finding the cell where the user is)
 - Perform handoff when user moves

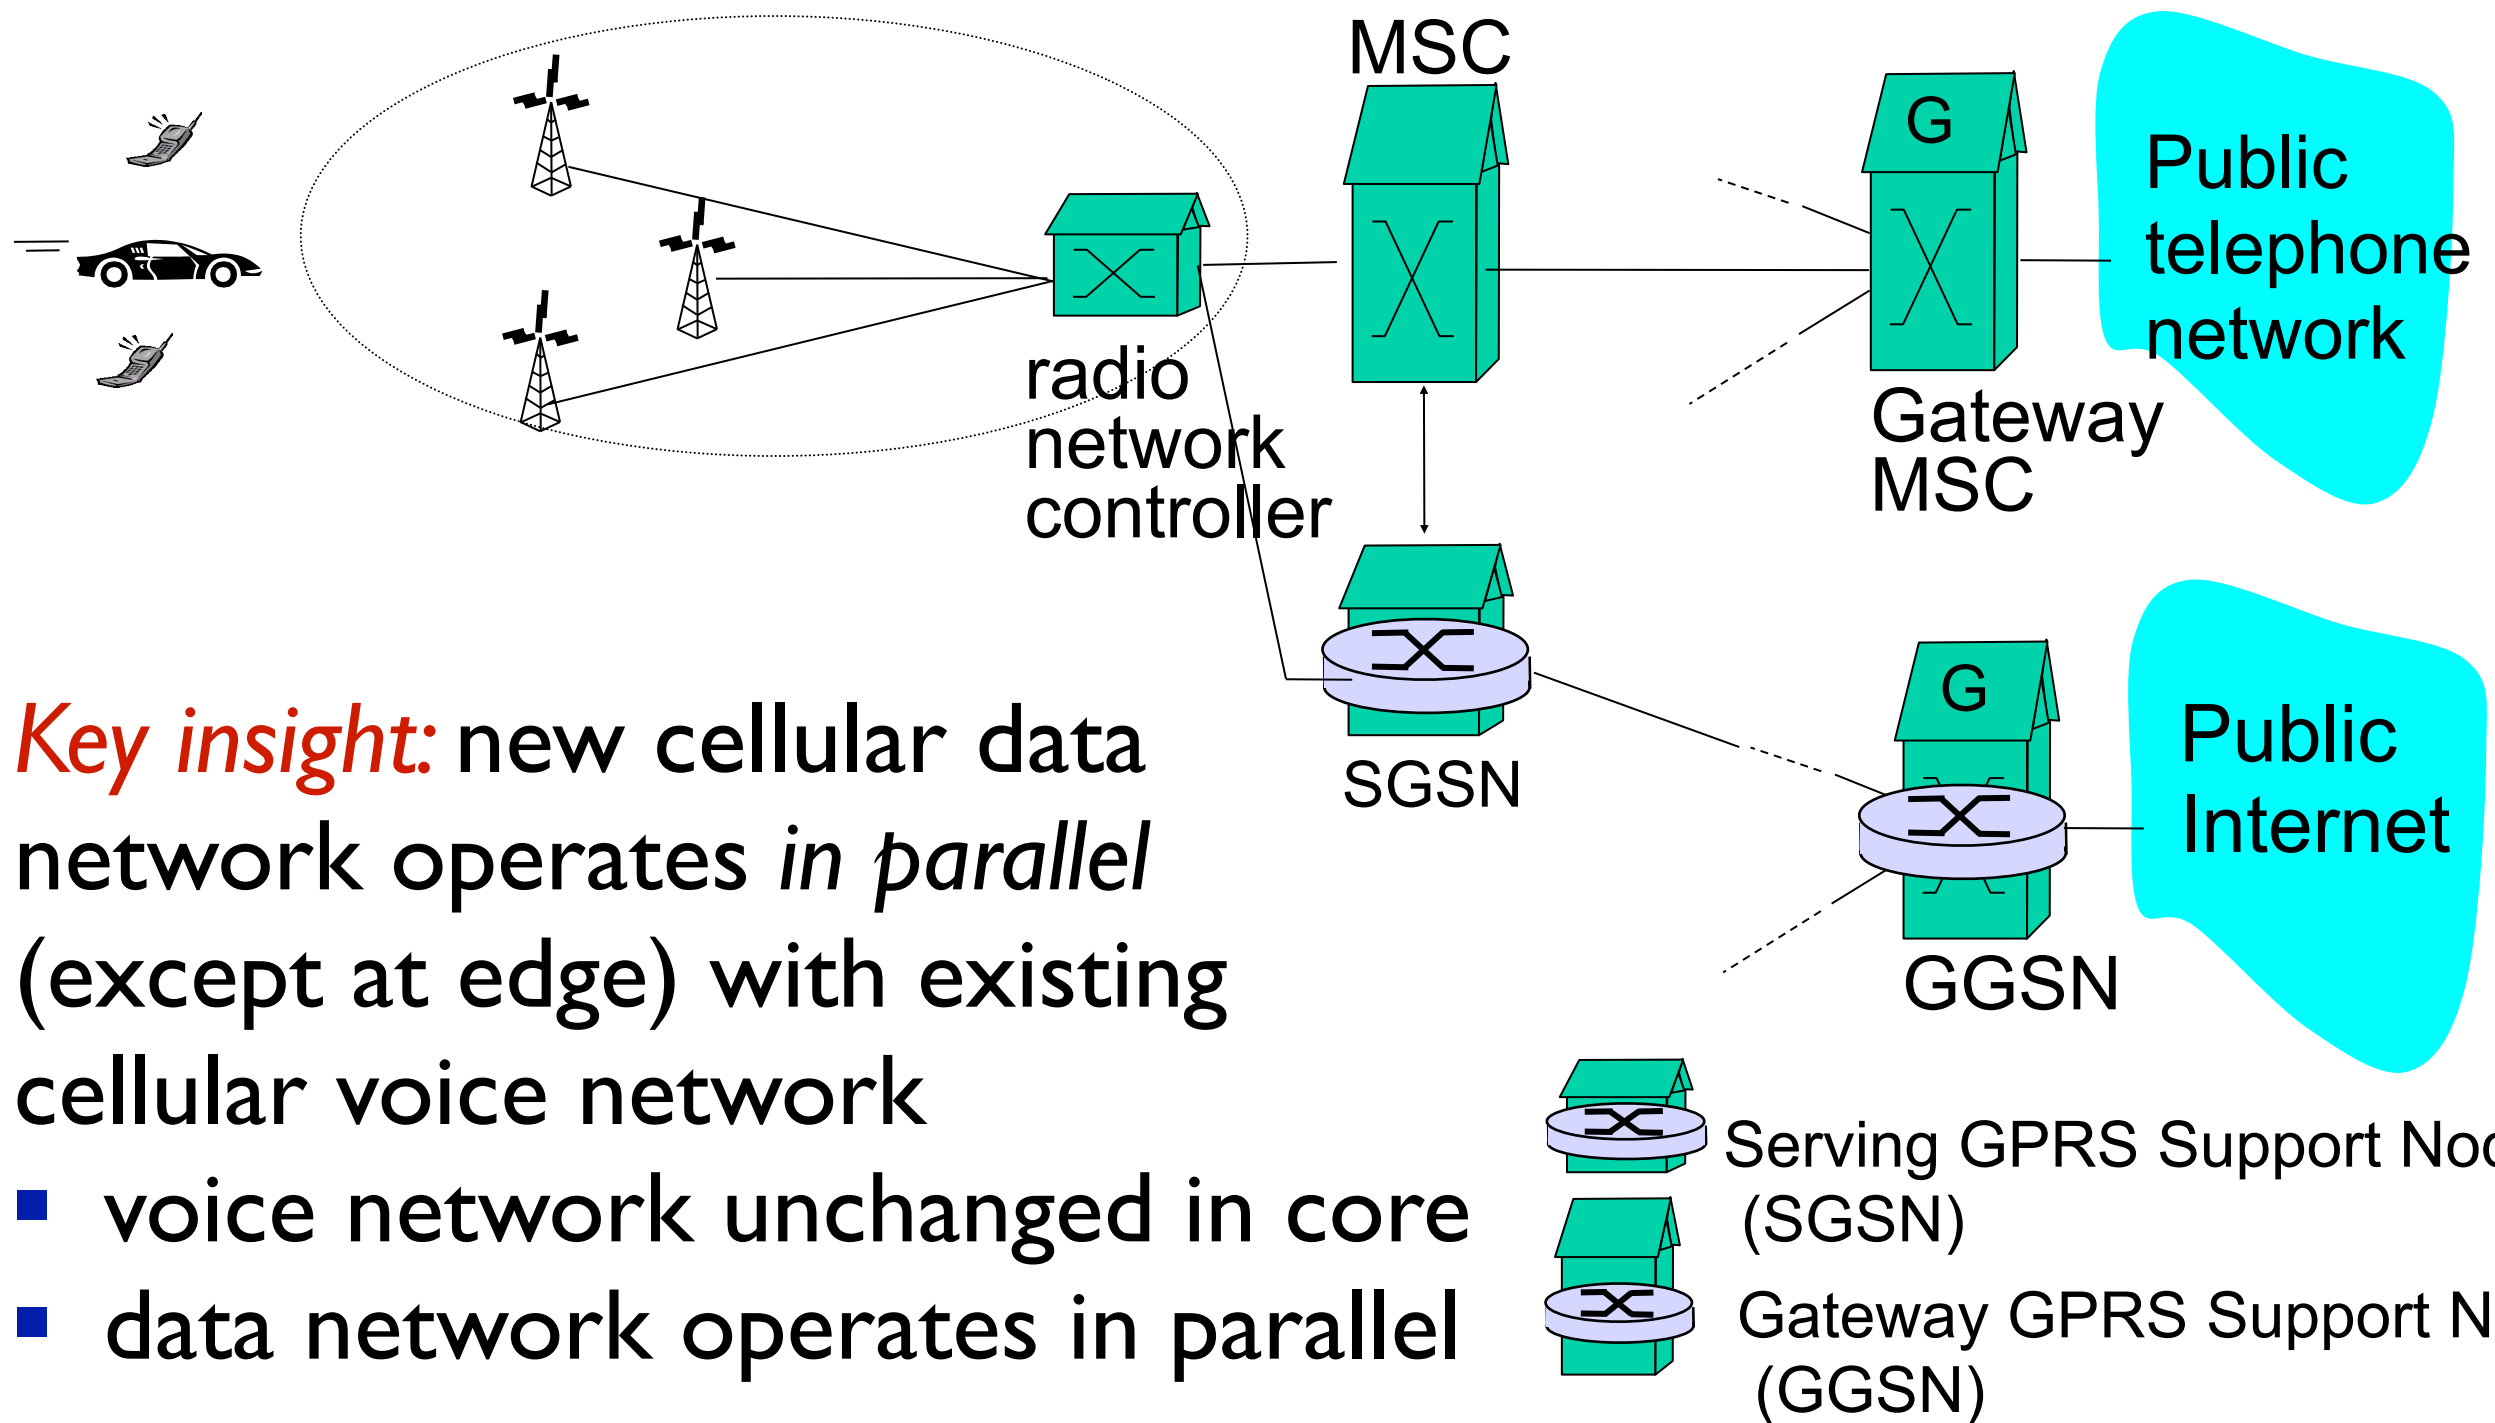

MSC

- MSC
 - Central role in user authentication and accounting
 - Decides if user can connect to cellular network
 - Provides call setup, teardown and handoff
 - Typically contains up to 5 BSCs, about 200K users
 - Call monitoring, charging
 - Multi-way calling, supplementary services
- Special MSC : Gateway MSC (GMSC)
 - Connects to public telephony network
- HLR/VLR
 - Subscriber's data base

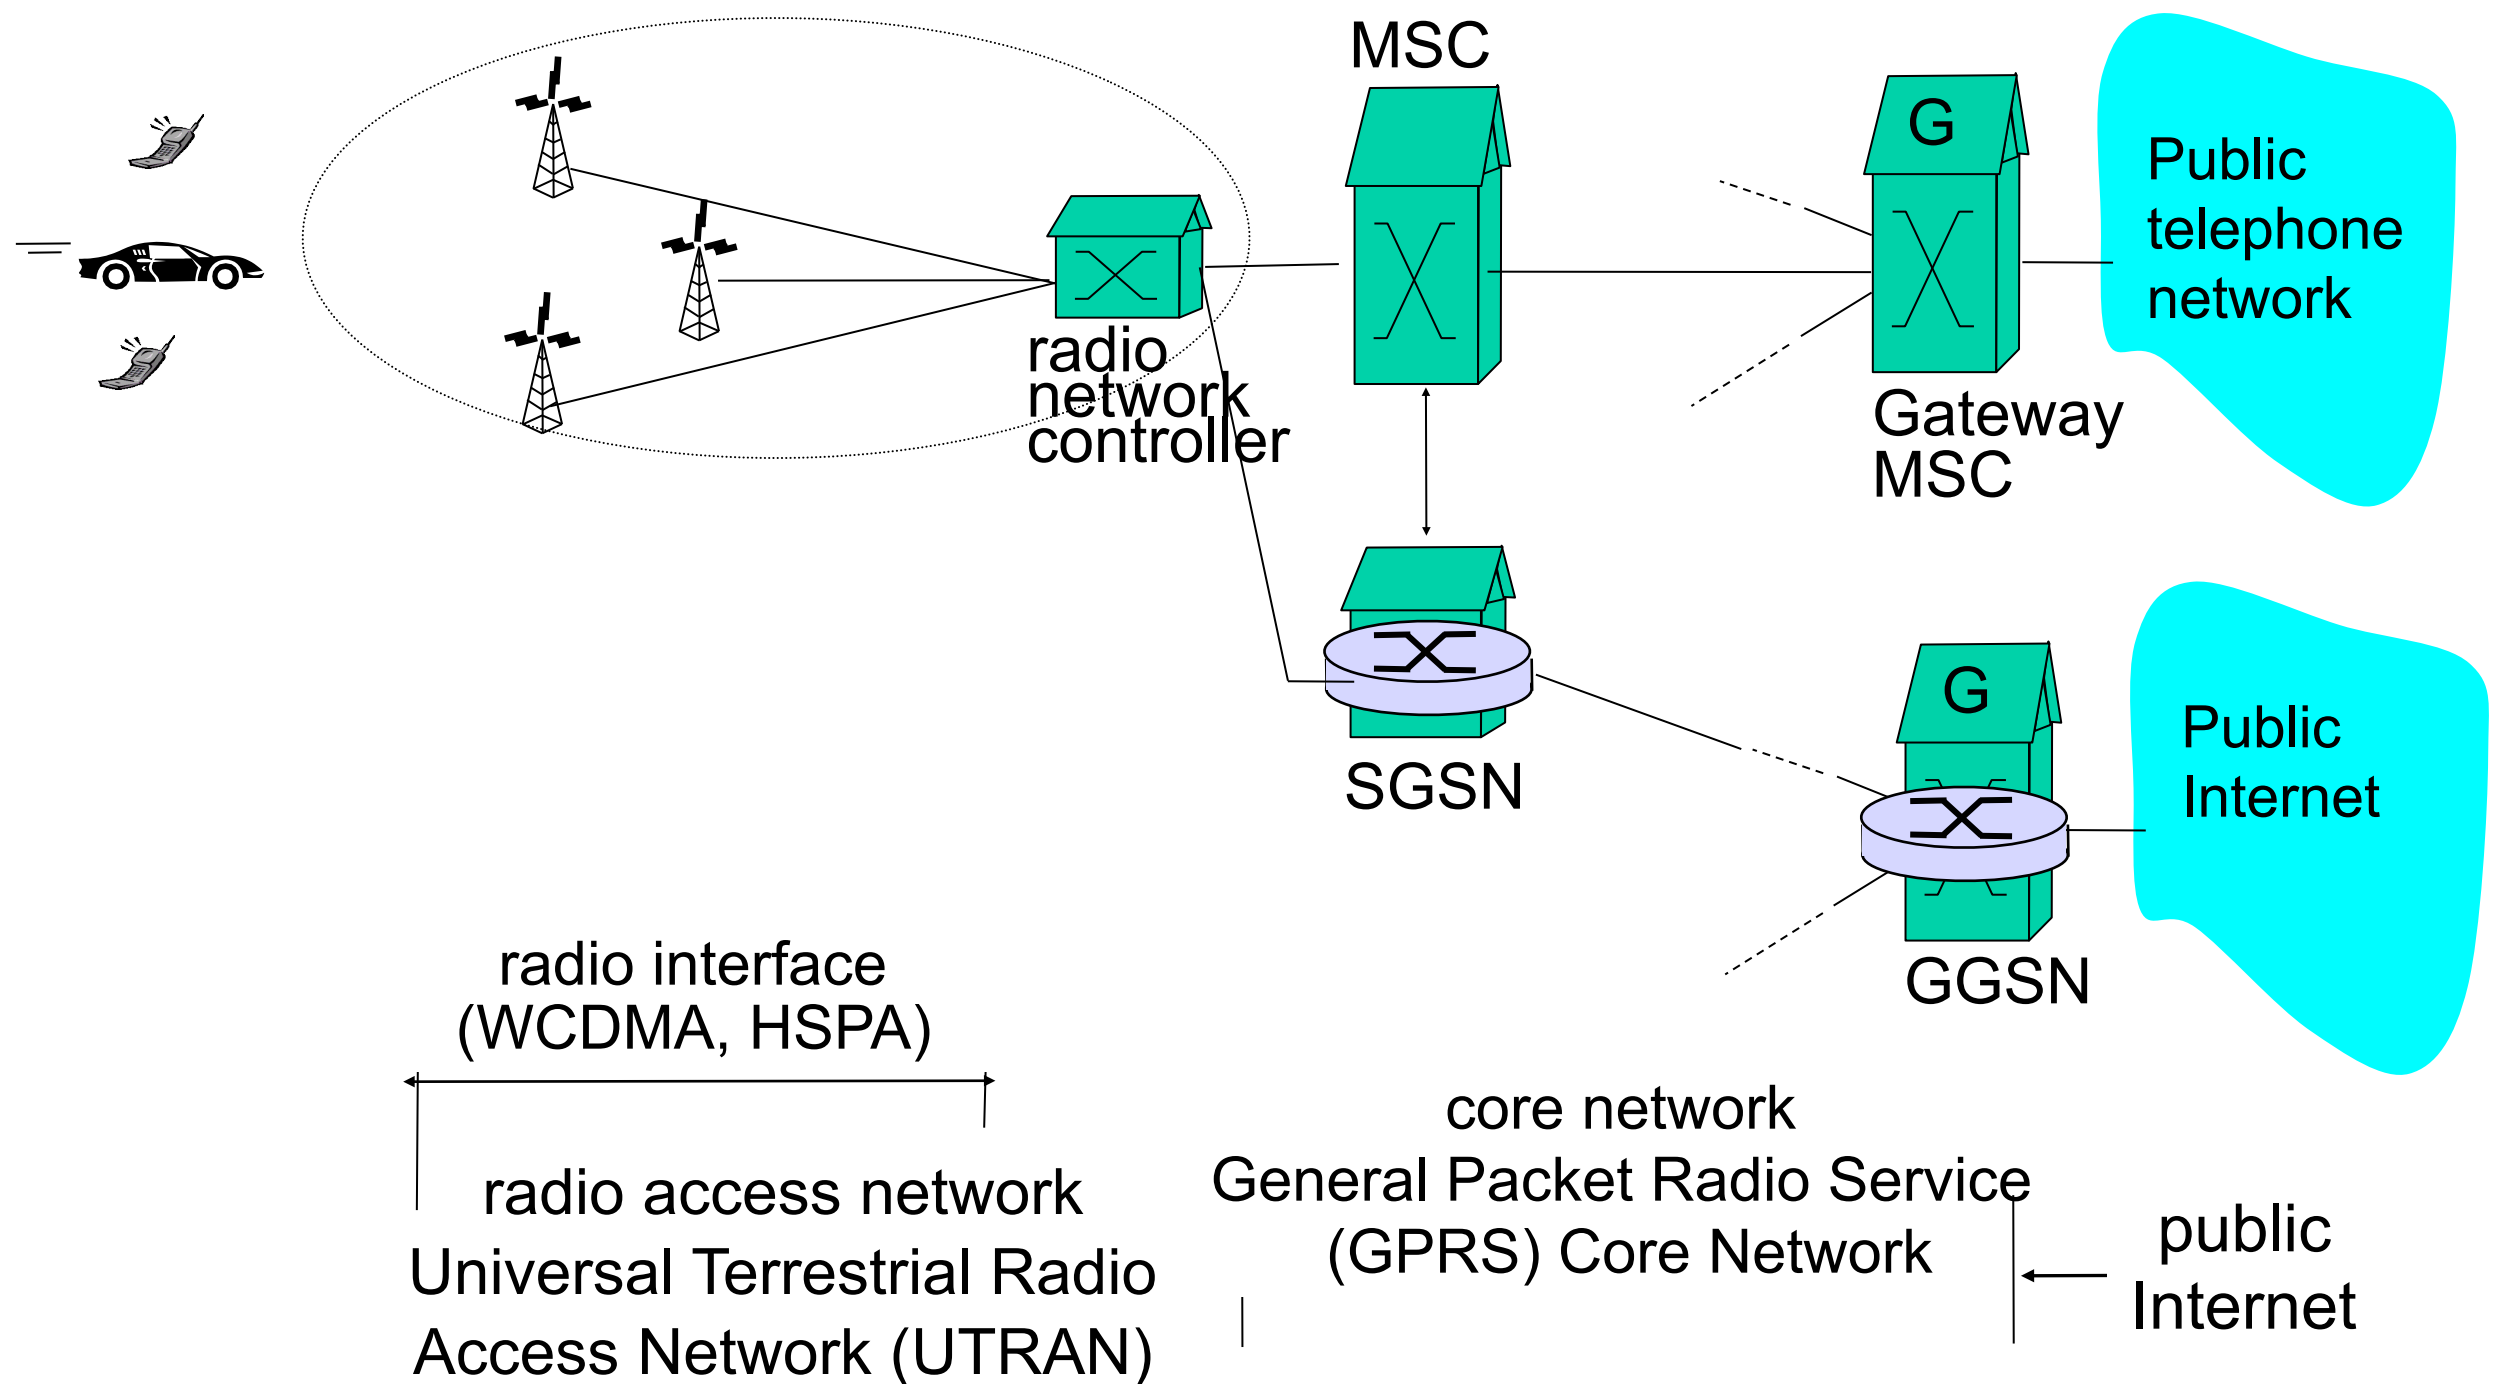

Localization and Calling

- Numbering schemes to locate and address MS
- MSISDN: A personalized number for user
 - Follows E.164 ITU standards
 - CC+NDC+SN
- IMSI: Uniquely identifies the SIM
 - MCC+MNC+MSIN
 - TMSI is used to hide the IMSI
- MSRN (Mobile Station Roaming Number)
 - Temp. number hides the identity/location of subscriber
 - VLR generates this number
 - VCC+VNDC+VSN
 - Helps finding of MS by an HLR for incoming call

3G (voice+data) network architecture

3G (voice+data) network architecture

On to 4G

- 2 important innovations over 3G (by 3GPP)
 - Evolved Packet Core (EPC),
 - LTE (Long Term Evolution)
- EPC
 - Simplified all IP core network
 - Carries both voice and data in IP packets
 - IP is best effort, not very well suited for voice
 - Can it provide QoS for telephony
 - EPC needs to manage network resources for QoS
 - Allows multiple types of RAN (Radio Access Networks)
 - Includes legacy 2G and 3G as well

On to 4G

– LTE Radio Access Network

- Uses combination of FDM and TDM with OFDM
 - Orthogonal: signals on 2 freq channel don't interfere
- Each MS is allocated one or more 0.5ms timeslot
 - One or more frequency channels
- To achieve higher bandwidth, more timeslots allocated
- Slot reallocation can be performed once every ms
- Uses MIMO antennas
 - Takes care of multipath, reflections etc.
- Downstream : 100 Mbps; upstream: 50 Mbps
- Allocation of time slots:
 - Implementation as per vendors equipment
 - Also based on user priorities (Gold, Silver, platinum)

Summary

- Overview of Cellular Architecture
 - BSS
 - BTS
 - BSC
 - MSC
 - GMSC
 - 3G
 - SGSN
 - GGSN
 - 4G
 - LTE
